Task 1

Create a Student class to represent student information using encapsulation.
The Student class should have the following private properties:

- **studentId (int)**: A unique identifier for each student.
- **name (String)**: The name of the student.
- **age (int)**: The age of the student.
- **grade (char)**: The grade of the student.

Requirements:

- All properties must be declared **private.**
- Provide **getter** and **setter** methods for name, age, and grade.
- The studentId should be generated **automatically** whenever a new student object is created.
- The studentId must not be modifiable externally, so do not provide a setter for it.
- Create a parameterized constructor to initialize the student's name, age, and grade.

Create a class called **GraduateStudent that extends Student**.Add one additional private property:

- **researchTopic (String)**: The research topic of the graduate student.

The GraduateStudent class should:

- Have a constructor that initializes **name, age, grade, and researchTopic**.
- Provide a **getter and setter** for researchTopic.

In the **main()** method:

- Create at least **two Student objects**.
- Create at least **one GraduateStudent object**.
- Display their information using getter methods.
- Update the name, age, or grade of at least one student using setter methods.
- Update the researchTopic of the graduate student using its setter.
- Display the updated information.
